IEEE 1471 - Wikipedia

Architecture is recognized as a critical element in successful software-intensive systems—complex systems where software contributes essential influences to the design, construction, deployment and evolution of the system as a whole. There is a growing body of knowledge in the application of architectural concepts to these systems to achieve the benefits of reduced costs and improved system qualities such as usability, flexibility, reliability, and interoperability.

The Architecture of Software-Intensive Systems

The software architecture of a program or computing system is a depiction of the system that aids in understanding how the system will behave. Software architecture serves as the blueprint for both the system and the project developing it, defining the work assignments that must be carried out by design and implementation teams.
