An architectural pattern is a general, reusable solution to a commonly occurring problem in software architecture within a given context. The architectural patterns address various issues in software engineering, such as computer hardware performance limitations, high availability and minimization of a business risk. Some architectural patterns have been implemented within software frameworks.

The layered architecture is the simplest form of software architectural pattern. If you are going to design a rudimentary application where the user count is very low ($< 100-200$) and you are sure that there won't be too much requirement changes after you go live, this is the best software architecture pattern to use.

Such architectural patterns are used in database replication and connecting peripherals to a bus. Pipe-filter pattern . If you are looking to create a system that produces and process streams of data, this would be a good one to choose. Individual processing steps are contained inside a filter, and the data that needs to be processed flows

In Pattern-Oriented Software

Architecture: A System of Patterns, the authors define these three types of patterns as follows: An Architecture Pattern expresses a fundamental structural organization or schema for software systems. It provides a set of predefined subsystems, specifies their responsibilities, and includes rules and guidelines for organizing the relationships between them.

Defining the Basic Characteristics of an Application: It has been observed that architecture patterns help in defining the basic characteristics and behaviors of an application. For instance, some architecture patterns can be naturally used for highly scalable applications, whereas others can be used for highly agile applications.

Architectural Patterns - Open Group applications is a good fit for this particular pattern. Extra application features can be added like plug-ins to the main applications through the use of microkernel architecture patterns. By adding the extra features, feature separation, isolation and extensibility are attained. Two kinds of architectural components are found in the microkernel pattern, the core system and plug-in modules.
