In this process, we describe the magnetic dipole moment, m, the elementary magnetic quantity of interest in materials, and its volume average or magnetization, M, and establish the inter-relationship between these fundamental magnetic parameters: B = ? 0 (H + M) in SI, and B = H + 4?M, in the CGS system of units. Following

# these definitions and presentation of related conceptual ideas, we provide a general overview of the variety of magnetic behavior observed in different materials.

Magnetism is a class of physical phenomena that are mediated by magnetic fields. Electric currents and the magnetic moments of elementary particles give rise to a magnetic moments. Magnetism is one aspect of the combined phenomenon of electromagnetism. The most familiar effects occur in ferromagnetic materials, which are strongly attracted by magnetic fields and can be magnetized to become permanent magnets, producing magnetic fields themselves. D
