In order to perform adequately multidisciplinary oral rehabilitation in partially edentulous patients with malocclusion, it is necessary to acquire skills in both orthodontic procedures and implant therapy (26,27). Most of participants were specialists in Orthodontics first.

Multidisciplinary oral rehabilitation in partially ...

The first stage of orthodontic treatment consisted of placing bands on the molars and bonding a fixed appliance to align and level with round archwires. This was followed by mesial movement of the permanent maxillary canines using elastics and open nickel-titanium (NiTi) coil springs, recreating space between the canines and the first premolars (Figure 2 a).

Multidisciplinary Approach in the Rehabilitation of ...

During this timeframe, the orthodontist proceeded with the alignment of the lower teeth (Figure 4). The final rehabilitation consisted of definitive implant-supported screw-retained fixed dental prostheses associated with additive composite reconstructions of the mandibular teeth performed by the prosthodontist (Figure 5(a)). The main goals of the treatment were achieved restoring stable and functional occlusion and chewing and speech abilities, together with a pleasant aesthetic.
