The chapters presented in Secondary Metabolism in Model Systems are a microcosm of what the recent completion, or near completion, of various genome projects are enabling biochemists to understand not only about control and regulation of secondary metabolism, and how various pathways relate to each other, but also about its relation to primary metabolism. A major paradigm shift is occurring in the way researchers need to view "secondary" metabolism in the future.It is also clear that model ...

Secondary Metabolism in Model Systems

Microbial secondary metabolites are low-molecular-mass products of secondary metabolism, usually produced during the late growth phase (idiophase) of microorganisms. They have unusual structures and their production arises from intracellular intermediates (amino acids, sugars, fatty acids, etc.), which are condensed into more complex structures by defined biochemical pathways.
