1) Define and Isolate D-regions. 2) Compute the resultant forces on each D-region boundary. 3) Select a truss model to transfer the forces across a D-region. 4) Select dimensions for nodal zones. 5) Verify the capacity of node and strut; for struts at mid-length and nodal interface. 6) Design the ties and tie anchorage.

A strut-and-tie model (STM) idealizes the complex flow of stresses in a structural member as axial elements in a truss member. Concrete struts resist the compressive stress fields, and reinforcing steel ties resist the tensile stress fields. Struts and ties intersect at regions called nodes.

## Strut-and-Tie Design: What They Didn't Teach You in School

Abstract. Strut-and-tie models (STMs) are often used for the design of shear critical deep members because they can rationalize the shear transfer within discontinuous or disturbed regions in reinforced concrete structural elements. Most current codes of practice adopt the strut-and-tie method but provide very little guidance on how to select appropriate strut-and-tie layout and dimensions.

Description This course presents the concepts and application of strut-and-tie modeling (STM) for structural concrete elements. Students will identify regions within structures where STM can be used for design, apply the methodology to locate and detail reinforcement, and check the capacity of their model.
